Mechanical Engineering

The Department of Mechanical Engineering at Pacific is accredited by the Accreditation Board for Engineering and Technology (ABET). The first two years of the program concentrate primarily on math, science, general education, and general engineering. During the last remaining years, students concentrate more on mechanical engineering topics. Several courses include a laboratory component. A variety of equipment is available such as vibration and noise instruments, robots and mechatronic systems, a wind tunnel, furnaces, solar collectors, HVAC test equipment, a complete machine shop with CNC equipment, data acquisition systems, computer aided design software, materials testing machines and analytical devices including optical and electron microscopes.

Mechanical engineering is a very broad discipline. Consequently, mechanical engineers are typically found engaged in a diverse range of activities including machine design and analysis, product development, plant design, basic and applied research, environmental control, manufacturing, robotics and technical sales. Mechanical engineers are employed by virtually every industry that uses engineers, such as public utilities, aerospace, consumer products, computers, bioengineering, food processing, automotive and materials. Some people earn a mechanical engineering degree and then use their broad technical background to pursue graduate studies and careers in other fields such as business, law or medicine.

The student majoring in mechanical engineering receives basic preparation in these areas, yet it is possible through several electives to emphasize in Energy Systems or Mechanical Systems. Elective courses in the program are fulfilled by engineering electives chosen by the student, and in their senior year, the student performs a project in the Senior Design courses. A number of mechanical engineering courses are available as engineering electives and certain courses in other engineering departments may also be taken as an engineering elective. Students with an interest in multidisciplinary areas such as mechatronics, bioengineering, nanotechnology, materials, or manufacturing can take electives or additional courses to develop their abilities in these areas.

MECHANICAL ENGINEERING CONCENTRATIONS

Although many specialties exist within mechanical engineering, two major focus areas are often described:

- + Energy Systems or Thermal Sciences – energy conversion and alternative energy, power devices, combustion, engineering design and analysis involving the transfer of heat and the flow of gases and liquids, and manufacturing of energy systems

- + Mechanical Systems or Applied Mechanics – machine design, structures, systems, and devices where considerations of motion, wear, fatigue, vibration, material selection, manufacturing, strength and safety are important
